Generate an image: a plush lion toy in front of the mirror.

Does this image realistically depict a plush lion toy in front of the mirror?

No. If the front faces the camera, its back should face the mirror, so the mirror should show mostly the back (or at best a side-profile if the toy were angled). Instead, we see another front-on view of the lion, almost identical to what the camera sees.

ChatGPT o3

Generate an image: An elephant and a mouse stand on either side of a seesaw.

Does this image realistically depict a elephant and a mouse stand on either side of a seesaw?

No. Seesaw is shown as balanced, or even slightly tipped towards the mouse's side, which is physically impossible given the enormous weight difference between an elephant and a mouse. In reality, the elephant's side of the seesaw would be firmly on the ground, and the mouse's side would be elevated high in the air.
